Using prior knowledge

The boy **eats**

semantic knowledge

Kamide, 2008; Mani & Huettig, 2012

Using prior knowledge

The boy eats the /k/...

lexical knowledge

Kamide, 2008; Mani & Huettig, 2012

Phonological representations can:

- **Activate** potential candidates
- Result in **competition** amongst candidates

Semantic information can further **constrain** candidate set.

Allopenna, Magnuson, & Tanenhaus, 1998; Marslen-Wilson, 1987

Developing active processing

Skills develop with experience

Developing active processing

18 months

Children can recognize a word from just the beginning phonetic segments

Fernald, Swingley, & Pinto (2001)

Developing active processing

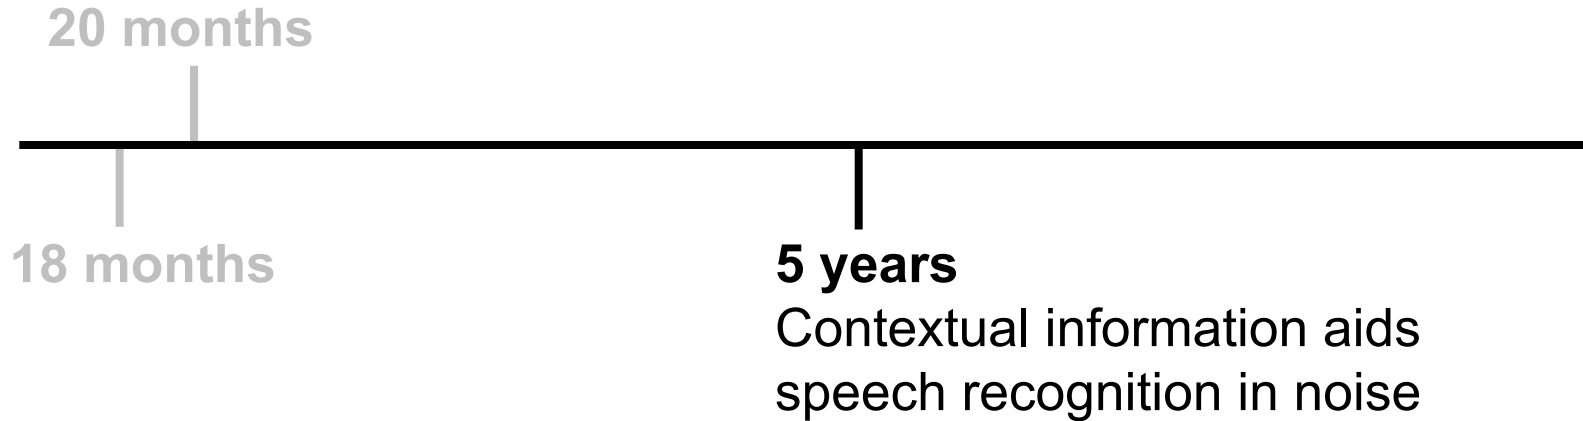

20 months

Children can use coarticulation cues to anticipate words

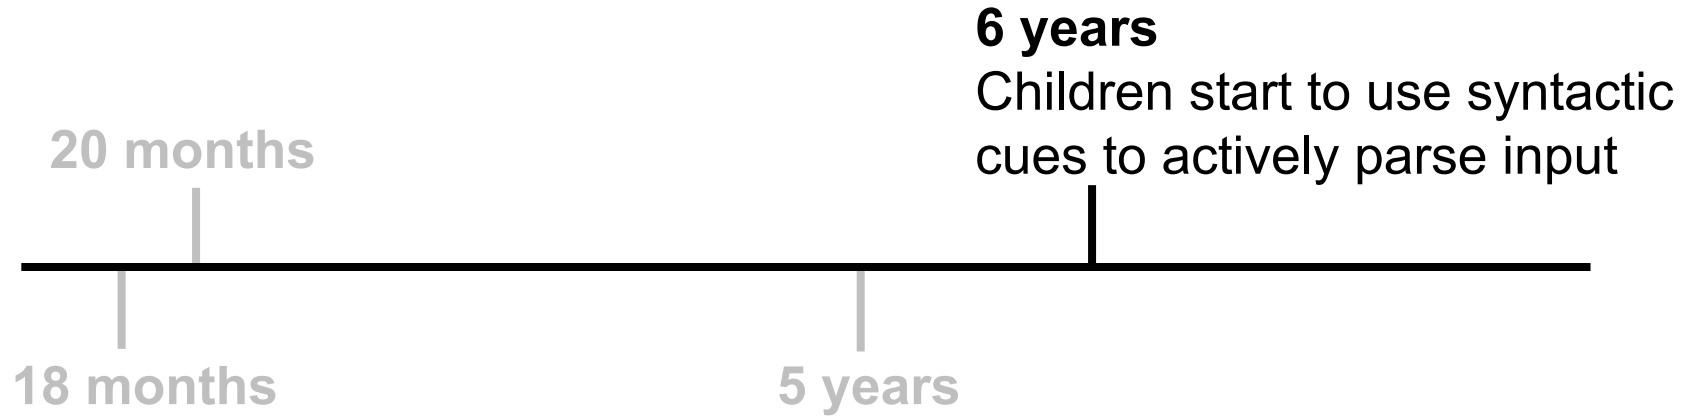

Mahr et al. (2015)

Developing active processing

Fallon, Trehub, & Schneider (2002)

Developing active processing

Atkinson, Wagers, Liz, Phillips, & Omaki (2018)

Developing active processing

Vocabulary

Experience that contributes to prior knowledge

Borovsky, Elman, & Fernald (2012); Borovsky, Ellis, Evans, & Elman (2016);
Graf Estes, Gluck, & Grimm (2016)

Research Questions

How does **phonological** and **semantic information** impact children's spoken word recognition?

- How do children respond to phonological competition?
- How do children use surrounding semantic information?
- How are these cues taken together?

Participants

Children **6-10 years of age**

- $N = 36$ ($M = 7.92$)
- Normal Hearing
- Monolingual English speakers

Visual World Paradigm

Find the **pencil**

Target

Competitor Conditions

Semantic Norming

Participants:

Children 5-10 years of age

- N = 26
- Normal Hearing
- Monolingual English Speakers

Image Relatedness Task:

Required 90% agreement with the target image

Brysbaert & Biemiller (2017); Kuperman, Stadthagen-Gonzalez, & Brysbaert (2012)

Experimental Conditions

Find the **pencil**

Prime Conditions

- No Prime
- Prime (Semantically-related)

Competitor Conditions:

- Phonological Onset Overlap
- Unrelated Distractor

Outcome Variables

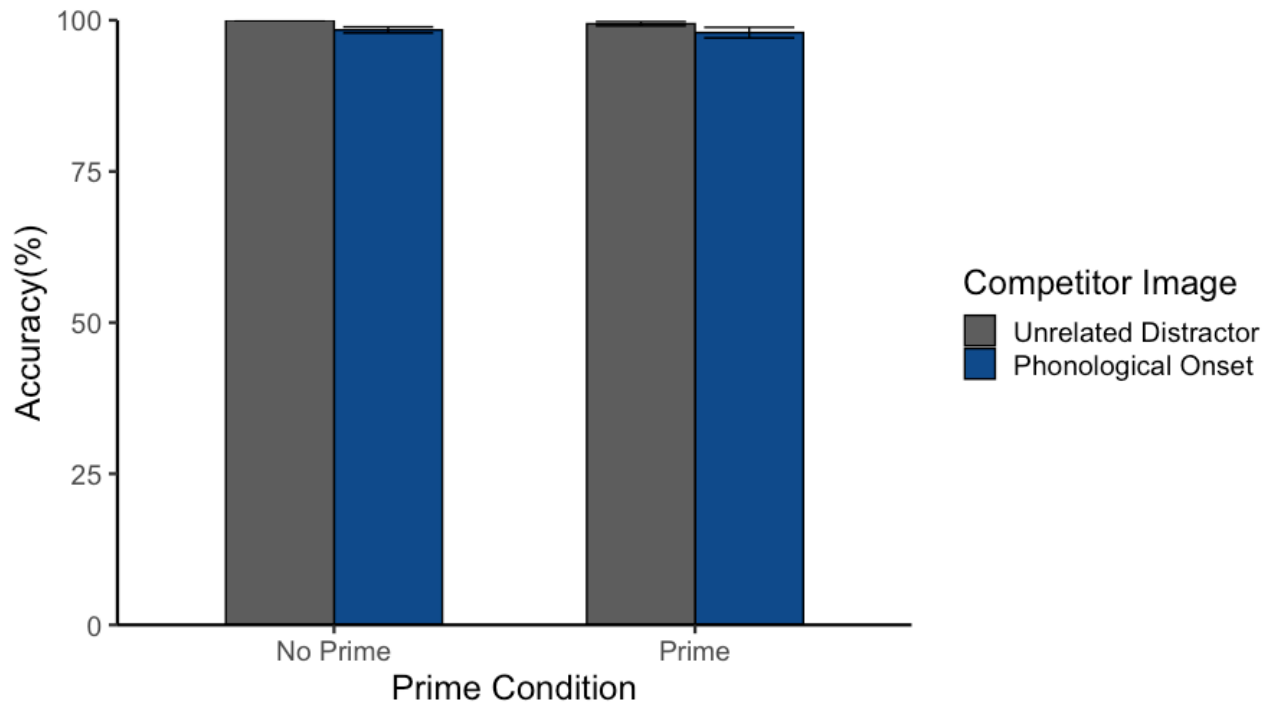

Two-Alternative Forced Choice Task

- Selection Accuracy

Eye Tracking Task

- Proportion of looks to the target image over time
- Speed of looking to the target

Selection Accuracy

Time course of spoken word recognition

Looks to the target image **over time**

Time is relative to the **onset of the target word**

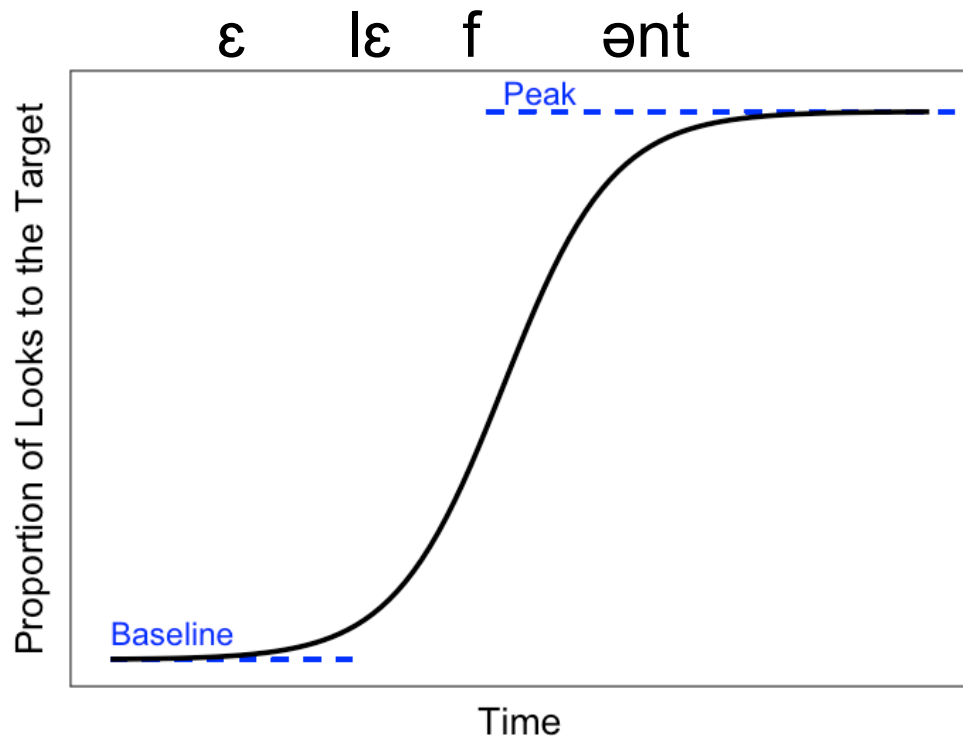

Time course of spoken word recognition

Looks before the onset
of the target word

McMurray (2019)

Time course of spoken word recognition

When looks to the listener commits to a target image

McMurray (2019)

Time course of spoken word recognition

Speed of looking to the target

McMurray (2019)

Time course of spoken word recognition

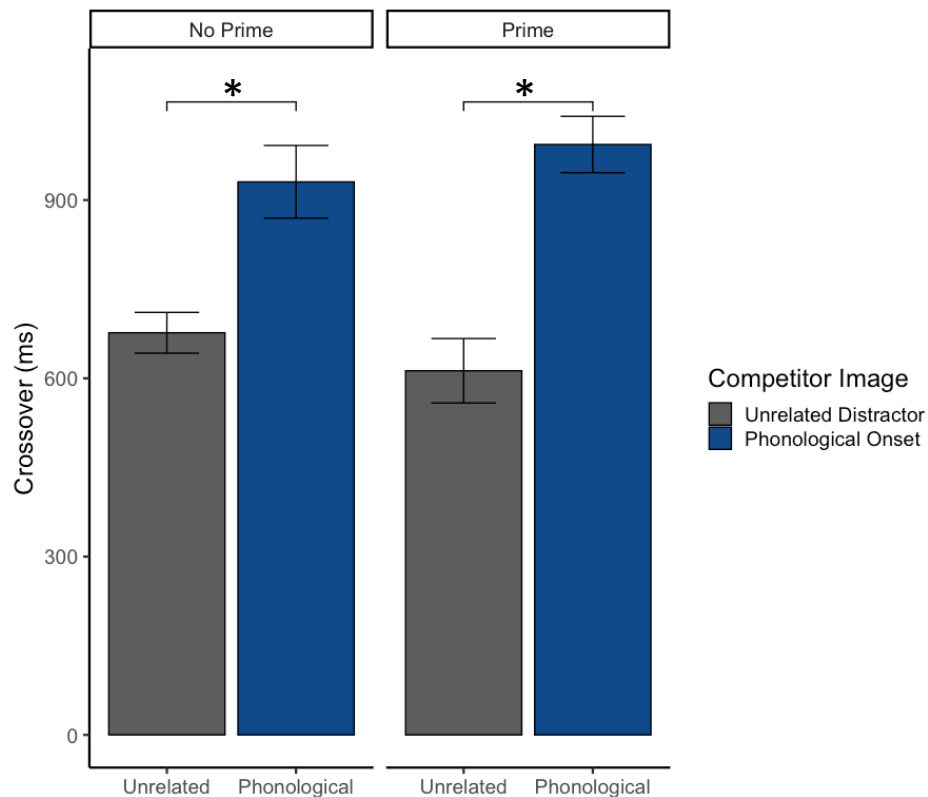

The midpoint between the baseline and peak

McMurray (2019)

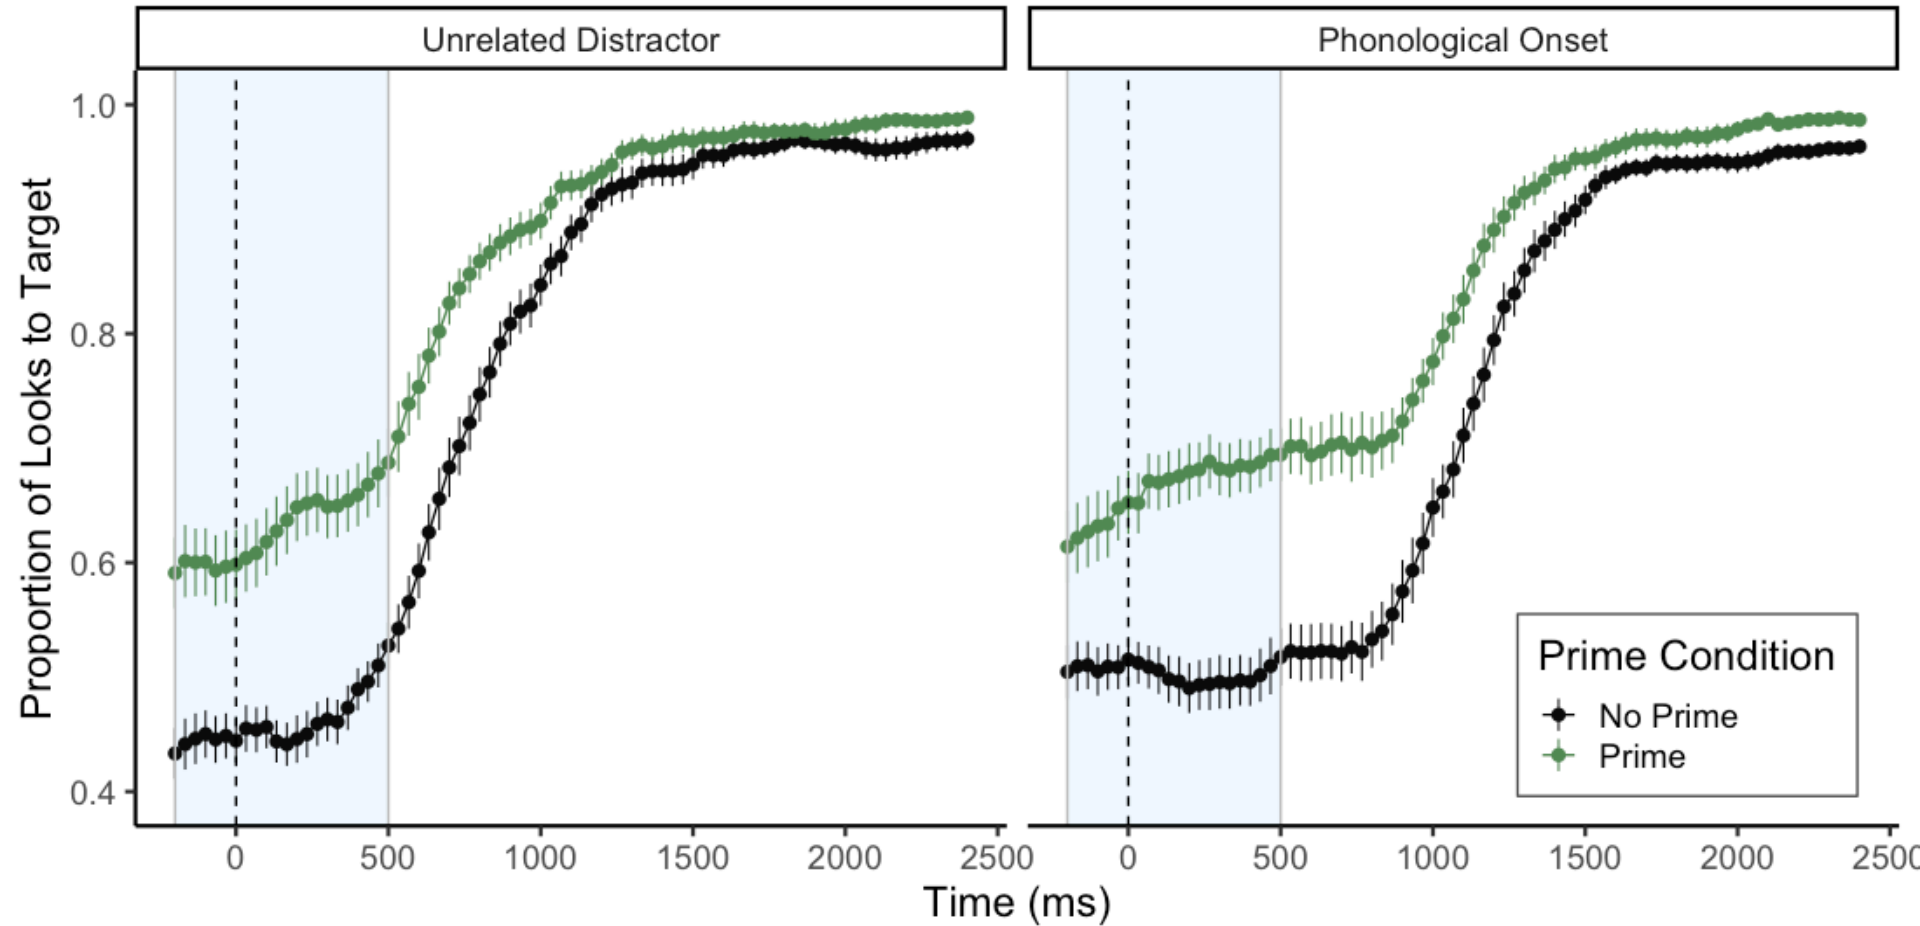

Phonological onset overlap result in later looks to the target

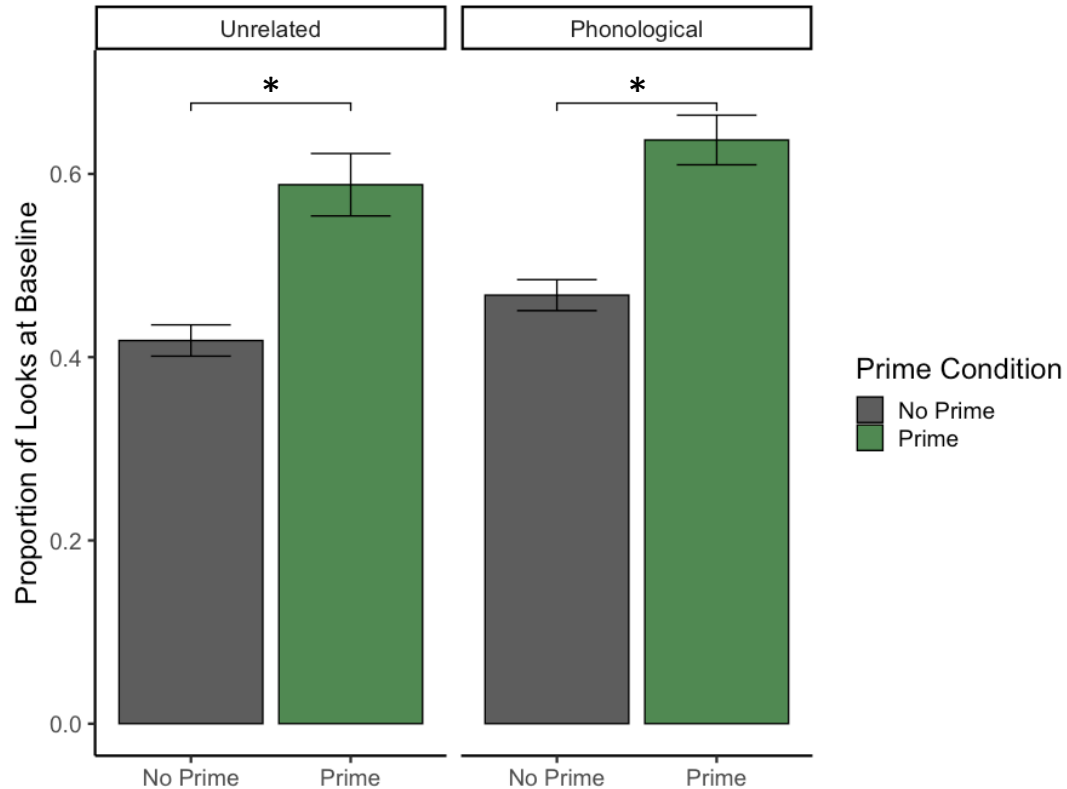

Phonological onset overlap result in later looks to the target

Semantic primes increase initial looks to the target

Semantic primes increase initial looks to the target

Children are sensitive to **phonological competition**

Semantic priming can facilitate spoken word recognition.

However, image primes do not get rid of phonological competition completely.

What is the semantic prime doing?

Facilitates a bias to the semantically-related image

However, semantic relations are not sufficient to commit to the target image.

Sheldon & Martin (1992)

Future Directions

How does **age** impact phonological competition and semantic relations?

How does **acoustic degradation** impact this process?
